

RDKit UGM 2025: Biopolymers, bond orders, stereochemistry, bioactivity, text mining and more.

Roger Sayle, Ph.D.

NextMove Software,

Cambridge, UK

a little about the author...

- Many, many years ago I wrote a molecular graphics program, RasMol, at the time the most popular program of its kind (over 1 million users).
- The two main file formats, PDB files and MDL Mol files each had unique properties and challenges.
- Converting between them lost information both ways! Residue information in PDB files, bond orders, formal charges and hydrogen counts in Mol files.
- This, and more generally 3D

 →2D, became a life long study (curse) and defines cheminformatics' core.

aTROPISOMErs in smiles

- Oc1ccc2cccc2c1-c1c(O)ccc2ccccc12 |wU:10.10| (S)-BINOL
- Tad Hurst's RDKit extension, based upon ChemAxon extension.

allenic stereochemistry

- OC(=O)C=[C@AL1]=CC(=O)O.CC(=O)N ALLCAM
- InChI=1S/C5H4O4/c6-4(7)2-1-3-5(8)9/h2-3H,(H,6,7)(H,8,9)/t1-/m0/s1
- Supported by InChI, Daylight, CDK. Ignored by RDKit, OpenBabel.
 14th RDKit UGM, Prague, Czech Republic, 11th September 2025

see-saw compounds and friends

- [S@OH1](F)(F)/C(=C(/[S@OH19](F)(F)F)C(F)(F)F)/C(F)(F)F CUVSOB
- Missing valences considered immediately after parent [like impH].

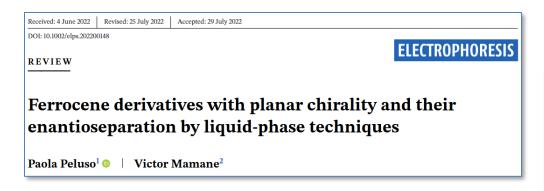

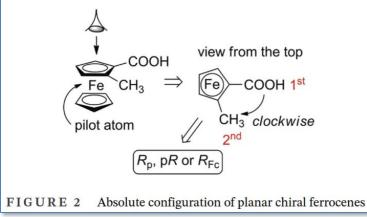

hapticity/piano stool compounds

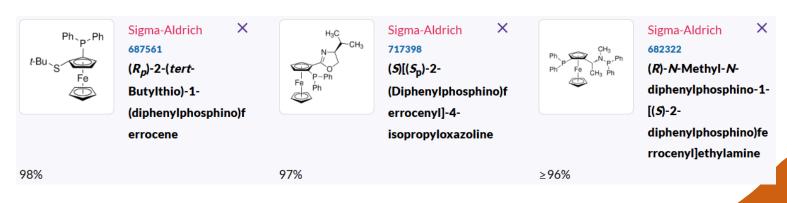

*[Mn](C#O)(C#O)(C#O).c1ccc[c-]1C |m:0:8.9.10.11.12|

Ferrocene chirality

haptic chirality

 Focusing on ferrocene chirality misses the bigger picture, that even half-sandwiches can be chiral.

updating proposals

May 2023 InChl workshop on stereochemistry

c1cccc1.*[Fe]*.c1c(N)c(O)cc1 | m:5:0.1.2.3.4,7:8.9.11.13.14 | c1cccc1.*[Fe]*.c1c(N)c(O)cc1 | m:5:0.1.2.3.4,7:14.13.11.9.8 |

August 2025 ACS Washington DC

[cH-]1cccc1.*[Fe+2][*@].[cH-]1c(N)c(O)cc1 |m:5:0.1.2.3.4,7:8.9.11.13.14| [cH-]1cccc1.*[Fe+2][*@@].[cH-]1c(N)c(O)cc1 |m:5:0.1.2.3.4,7:8.9.11,13.14|

unspecified haptic chirality

 A proposal is that for multi-centre bonding where the stereochemistry is unspecified, this should be indicated by a wavy bond.

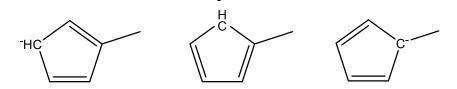

- This is analogous to 2D depictions where double bond stereochemistry is implied by co-ordinates.
- Wavy bonds not required when non-chiral.

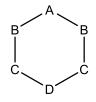

Determining haptic chirality

 An "Eta-system" is not chiral if it has a plane of symmetry (ignoring bond orders and formal charges).

- Number of odd-sized symmetry classes less than 2-(system size mod 2).
 - 5-membered ring, 1 odd-sized symmetry class
 - 6-membered ring, ≤ 2 symmetry class.

myths of biopoLymers

- There are a small (manageable) number of monomers.
- There's a one-to-one mapping between monomers and all-atom representations.
- HELM/MonomerMol representations are sufficient.

pubchem contains...

- 122,270,062 compounds (September 2025)
- > 35,811 amino acid monomers
 - $> 20,361 \beta$ -alanine monomers
- > 6,893 nucleotide monomers
- > 3,699 monosaccharide monomers
- > 2,385 substituent (SAG) monomers
 - > 1,441 Fatty acid monomers
- > 97 lipid monomers

How many Amino acids present?

20 common amino acids

Ala, Cys, Lys, Thr

87 amino acido

Ala, Cys, Hcy, Lys, 2Nal, Ncy, Thr

1095 including substituents

3546 including stereo variants, terminal variants, linker variants, α-methylated

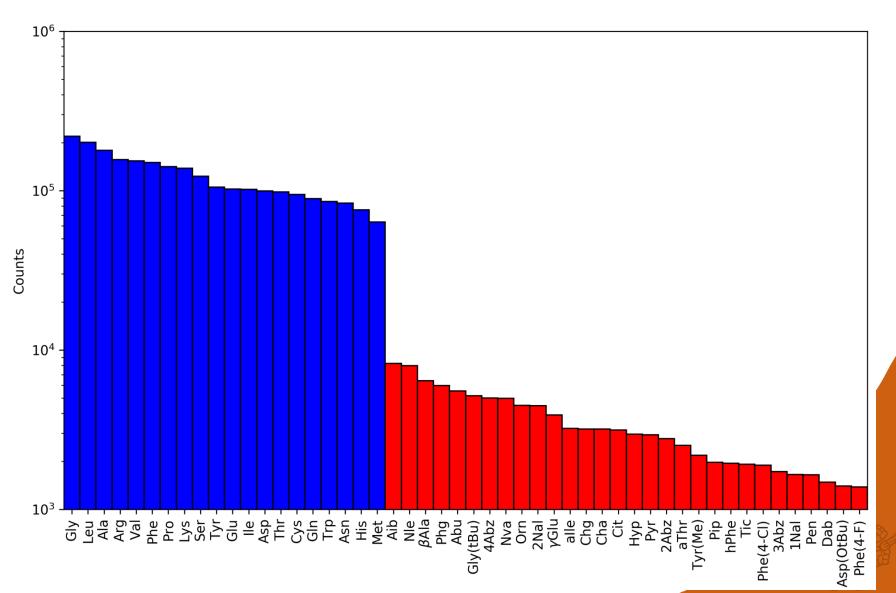

Thr, D-Thr, DL-Thr, aThr, Thr-ol, aMeThr

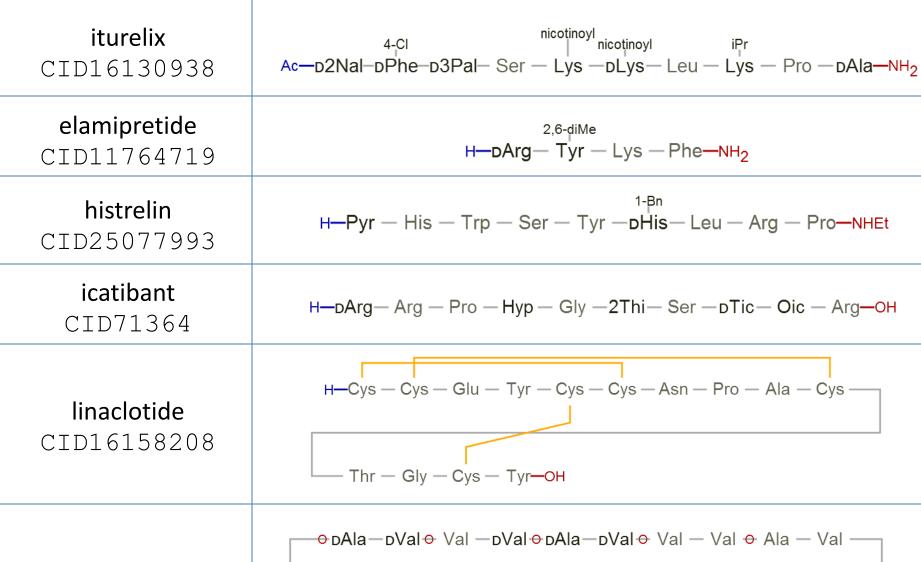

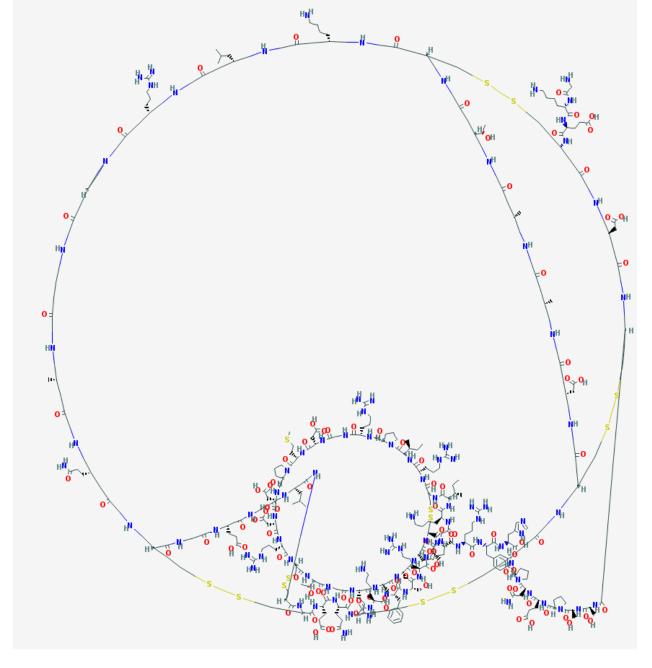

8125 including N-substituted variants

Thr, Me-Thr, Boc-Thr, Me₂-Thr, Fmoc-N(Me)Thr

Amino acids in PubChem Structures containing at least three amino acids

fasta to smiles is the easy bit

- Many monomers exist in alternate forms due to protonation and tautomerization.
- Physiological vs. neutral forms differ.
- Histidine forms HID, HIE and HIP.
- Representation of nitro groups, azides, etc.
- Often overlooked is undefined chirality.

Biovia vs. pistoia helm issues

- RDKit's implementation doesn't have Biovia's bugs.
- The monomer phase problem in RNA registration:

– Sequence: GATTACA

– Interpretation: 5'-G-A-T-T-A-C-A-3'

– Implied phosphates: 5'-G-P-A-P-T-P-T-P-A-P-C-P-A-3'

– IUMB/PDB/Biovia: G-PA-PT-PT-PA-PC-PA

— Pistoia HELM: GP-AP-TP-TP-AP-CP-A

 This discrepancy complicates RNA registration and leads to serious bugs in Biovia's HELM support.

Expanded SCSR file

select molfile(mol('RNA1{R(A)P.R(T)P.R(C)P.R(G)}\$\$\$\$')) from dual;

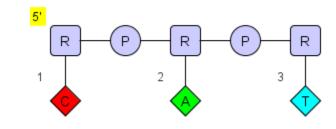

Rdkit helm implementation

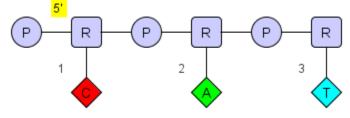

No Caps Flavor =2

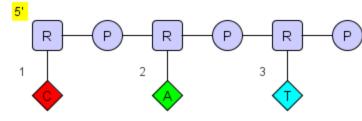

5'-Cap Flavor = 3

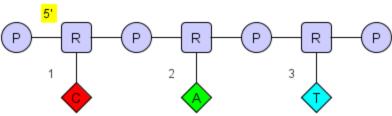

3'-Cap Flavor = 4

Both Caps Flavor = 5

Schrödinger HELM

- Rachel Walker's talk this morning introduced in an interesting variant:
 - PEPTIDE1{C.G.D(K)}\$\$\$V2.0
- Attempting to read this with the Pistoia Alliance's
 HELM editor results in the error message: Unknown
 HELM_AA monomer name "D(K)", and the validate
 HELM call fails.
- Admittedly, this was in a proposal for monomer substructure search.

glycoct bond src/dst qualifiers

- For most amino acids, stereochemistry is within the monomer and can be defined by its definition.
- But for oligosaccharides (and metalloproteins) the stereochemistry occurs between monomers.
- The GlycoCT file format has connection semantics:
 - h exchange of H
 - r exchange of R-prochiral H
 - s exchange of S-prochiral H
 - o exchange of O
 - c exchange of backbone carbon

inline helm (If you've not seen it)

- Ac(1)-Ala-Cys(1)-OH
 - PEPTIDE1{[*CC(=O)* |\$_R3;;;_R2\$|].A.C}\$
 PEPTIDE1,PEPTIDE1,1:R3-3:R3\$\$\$
- H-Ncy(1)-Ala-Cys(1)-OH
 - PEPTIDE1{[N[C@@H](S*)C(=O)* |\$;;;_R3;;;_R2\$|].A.C}\$
 PEPTIDE1,PEPTIDE1,1:R3-3:R3\$\$\$
- N4-acetylcytidine (ac4Cyt-Ribf)
 - RNA1{R([CC(=O)Nc1ccn(*)c(=O)n1 |\$;;;;;;,R1;;;\$|])}\$\$

Helm teething problems

- Pistoia's HELM notation marks a significant advance over the limitations of one-letter bioinformatics.
- Alas, its original goals didn't include data exchange, which has only recently been addressed by the extensions of inlineHELM and XHELM [and fixes from NextMove Software for improved interoperability].
- Alas, this still doesn't address some core limitations:
 - Pistoia Monomer Library: PEPTIDE1{[fmoc].A}\$\$\$\$
 - EBI ChEMBL Monomers: PEPTIDE1{[Fmoc_A]}\$\$\$\$

helm dialects

- Heptares/ChemAxon HELM (Conor Scully 20018)
 - CHEM1{[Ac]}|PEPTIDE1{R.K.C.Y.[D-Leu].P.E.C.S.F}| CHEM2{[NH2]}\$PEPTIDE1,CHEM1,1:R1-1:R1| PEPTIDE1,CHEM2,10:R2-1:R1\$\$\$V2.0
 - "CHEM{[Ac]}" is usually "PEPTIDE{[ac]}" in HELM.
 - "[D-Leu]" is more commonly "[dL]" in HELM.
 - "CHEM{[NH2]}" which has formula NH₃ is traditionally
 "PEPTIDE{[am]} in Pistoia/Pfizer HELM.
 - PEPTIDE1{[ac].R.K.C.Y.[dL].P.E.C.S.F.[am]}\$\$\$\$

Isotyping antibody chains

• Antibody chains may be classified into isotypes using global (NWS) sequence alignment [n.b. not blastp].

•	Light chains	UNIPROT	ChEMBL19 count
	– Ig kappa [human]	IGKC_HUMAN	131
	– Ig lambda [human]	LAC2_HUMAN	12
	– Ig kappa [mouse]	IGKC_MOUSE	7
•	Heavy chains		
	– Ig gamma-1 [human]	IGHG1_HUMAN	105
	– Ig gamma-2 [human]	IGHG2_HUMAN	13
	– Ig gamma-4 [human]	IGHG4_HUMAN	21
	– Ig gamma-1 [mouse]	IGHG1_MOUSE	2
	– Ig gamma-2A [mouse]	GCAA_MOUSE	2
	– Ig gamma-2B {secreted} [mouse]	IGG2B_MOUSE	1
	– Ig mu {secreted} [human]	IGHM_HUMAN	1 (Panobacumab)

chemical text mining

- From PubMed 5120, May 1976:
 - Brain kininase A hydrolyzes the Phe5-Ser6 peptide bond in bradykinin (Bk), Arg1-Pro2-Pro3-Gly4-Phe5-Ser6-Pro7-Phe8-Arg9. It is isoelectric near pH 5.2 and has a molecular weight of approximately 71 000. The enzyme also hydrolyzes the Phe-Ser peptide bond in Lys-Bk, Met-Lys-Bk, des-Arg1-Bk, Lys9-Bk, Pro-Gly-Phe-Ser-Pro-Phe-Arg, and Gly-Pro-Phe-Ser-Pro-Phe-Arg, but does not hydrolyze (0.1%) this bond in des-Phe8-Arg9-Bk.
- OPSIN doesn't handle trivial names (use a dictionary).
- Inorganic (Red Book) nomenclature: vanadium oxytrichloride,
- Phane nomenclature: From US20250223300A1
 - 2⁶-methyl-5⁶-(9-(oxetan-3-yl)-3,9-diazaspiro[5.5]undecan-3-yl)-5¹H-10-oxa-4-aza-5(2,1)-benzo[d]imidazola-1(3,4),2(2,4)-dipyridinacyclodecaphan-3-one

evaluating bond order perception

- GDB is a poor proxy for chemical space, given the element and hetero-neighbor constraints.
- The MMFF94 validation suite may provide a better coverage of functional groups/relevant chemistry.
- All atom inputs, with explicit hydrogens and perfect geometries, are obviously "easier" than real world data, such as ligands from PDB files.

evaluating bond order perception

- Apologies to Jan and Greg, the truly terrible SMILES in Greg's blog post are from the original QM9 data files, that we're (I believe) supposed to be an implementation of my "Cruft to Content" work.
- I can confirm that as described preserves the correct hydrogen count, and doesn't generate radicals.
- The motivation was that using CSD's bond perception logic (d < Rcov(i)+Rcov(j)+0.45) might perform better or as well as Jan's d < 1.3*(Rcov(i)+Rcov(j)) logic.

Distance geometry

- RDKit's bounds matrix is poorly constrained.
- For acetonitrile, CC#N, with no "freedom"
 - $C^0-C^1 1.453-1.473$
 - $C^1 \# N^2 = 1.147 1.167$
 - $-C^0..N^2$ 2.58-2.64

Trigonometry: > 155.35°

- The "ideal" bond lengths/angles used by molecular mechanics forcefields are misleading, and are not the expected values in the final minimized structure.
- Substructures (sub distance matrices) like thiophene should have no degrees of freedom (rigid bodies).

μÅ atomic accuracy

- A quick word on Patrick's complaints on 4-digit accuracy in V2000 Mol files.
 - RasMol rounded atomic co-ordinates to 1/256th Å.
- The remarkable reproducabilty of (¹⁹F-)NMR is the result of statistical mechanics (the central limit theorem) averaging the observations of trillions of molecules, over multi-second time scales, bombarded by solvent at room temperature (295 K).
- Yes, the energy surface is steep (and 2Å RMS as a definition of good is a rant for another day)...

final remarks

- It has been a fantastic RDKit UGM.
- A number of impressive improvements.
- Less to complain about that previous years.
